

Combinations of Power Generation Methods to Correspond to Power Supply and Demand

Concept image of supply and demand on day of lowest demand (sunny day in May, etc.)

In order to achieve stable usage of power, the amount of power generated (supply) and amount of power consumed (demand) must be made always equal. For that purpose, the amount of power generated and the amount of power consumed must be balanced using methods such as thermal power generation that can compensate for the fluctuations in output from renewable energy.
